Announcement

- Mini-HW 5 released
 - Due on **10/26 (Thu) 17:20**
- Homework 1 due soon
- Homework 2
 - Due on **11/09 (Thur) 17:20 (4 weeks)**
- TA Recitation (next week)
 - **10/26 (Thu) at R103**
 - Homework 1 QA
- Another course website you can get the videos sooner
 - <http://ada.miulab.tw>
- Note: if you have questions about the homework, please find TAs
 - Frequently check the website for the updated information!

Mini-HW 5

Mini HW #5

Due Time: 2017/10/26 (Thu.) 17:20

Contact TAs: ada-ta@csie.ntu.edu.tw

Suppose you have 4 kinds of objects, each kind of them has its own weight w_i , value v_i , and quantity n_i . Now you would like to maximize the total values while the total weights cannot exceed 8.

Information of these objects:

i	w_i	v_i	n_i
1	3	6	2
2	4	5	1
3	1	1	3
4	2	4	2

- (1) Please fill the DP table below, where $dp[i][j]$ indicates the maximum values you can get with weight less or equal to j using objects 1 to i . (6pt)
- (2) Use the DP table to find out one of the solution and briefly explain how. (4pt)

$i \setminus w$	0	1	2	3	4	5	6	7	8
1	0								
2	0								12
3	0								
4	0			6					

Outline

- Dynamic Programming
- DP #1: Rod Cutting
- DP #2: Stamp Problem
- DP #3: Matrix-Chain Multiplication
- DP #4: Sequence Alignment Problem
 - Longest Common Subsequence (LCS) / Edit Distance
 - Space Efficient Algorithm
 - Viterbi Algorithm
- DP #5: Weighted Interval Scheduling
- DP #6: Knapsack Problem
 - 0-1 Knapsack
 - Unbounded Knapsack
 - Multidimensional Knapsack
 - Multi-Choice Knapsack
 - Fractional Knapsack

動腦一下 – 囚犯問題

- 有100個死囚，隔天執行死刑，典獄長開恩給他們一個存活的機會。
- 當隔天執行死刑時，每人頭上戴一頂帽子(黑或白)排成一隊伍，在死刑執行前，由隊伍中最後的囚犯開始，每個人可以猜測自己頭上的帽子顏色(只允許說黑或白)，猜對則免除死刑，猜錯則執行死刑。
- 若這些囚犯可以前一天晚上先聚集討論方案，是否有好的方法可以使總共存活的囚犯數量期望值最高？

猜測規則

- 囚犯排成一排，每個人可以看到前面所有人的帽子，但看不到自己及後面囚犯的。
- 由最後一個囚犯開始猜測，依序往前。
- 每個囚犯皆可聽到之前所有囚犯的猜測內容。

Example: 奇數者猜測內容為前面一位的帽子顏色 → 存活期望值為75人

有沒有更多人可以存活的好策略?

Vote for Your Answer

囚犯問題中，你覺得最高的存活人數期望值為多少？

Review

Algorithm Design Paradigms

- Divide-and-Conquer
 - partition the problem into **independent or disjoint** subproblems
 - repeatedly solving the common subsubproblems
- more work than necessary
- Dynamic Programming
 - partition the problem into **dependent or overlapping** subproblems
 - avoid recomputation
 - ✓ Top-down with memoization
 - ✓ Bottom-up method

Dynamic Programming Procedure

1. **Characterize the structure** of an optimal solution
 - ✓ Overlapping subproblems: revisit same subproblems
 - ✓ Optimal substructure: an optimal solution to the problem contains within it optimal solutions to subproblems
2. **Recursively define the value** of an **optimal** solution
 - ✓ Express the solution of the original problem in terms of optimal solutions for subproblems
3. **Compute the value** of an optimal solution
 - ✓ typically in a bottom-up fashion
4. **Construct an optimal solution** from computed information
 - ✓ Step 3 and 4 may be combined

DP#4: Sequence Alignment

Textbook Chapter 15.4 – Longest common subsequence

Textbook Problem 15-5 – Edit distance

Monkey Speech Recognition

- 猴子們各自講話，經過語音辨識系統後，哪一支猴子發出最接近英文字"banana"的語音為優勝者
- How to evaluate the similarity between two sequences?

aeniqadikjaz

banana

svkbr1vpnzanczyqza

Longest Common Subsequence (LCS)

- Input: two sequences $X = \langle x_1, x_2, \dots, x_m \rangle$
 $Y = \langle y_1, y_2, \dots, y_n \rangle$
- Output: longest common subsequence of two sequences
 - The maximum-length sequence of characters that appear left-to-right (but not necessarily a continuous string) in both sequences

$X = \text{banana}$

$Y = \text{aeniqadikjaz}$

$X = \text{banana}$

$Y = \text{svkbrlvpnzanzyqza}$

4

$X \rightarrow \text{ba}-\underline{n}-\underline{\text{an}}-\underline{\text{a}}-\underline{\text{a}}$
 $Y \rightarrow -\underline{\text{a}}\underline{\text{e}}\underline{\text{n}}\underline{\text{i}}\underline{\text{q}}\underline{\text{a}}\underline{\text{d}}\underline{\text{i}}\underline{\text{k}}\underline{\text{j}}\underline{\text{a}}\underline{\text{z}}$

5

$X \rightarrow \text{---}\underline{\text{b}}\underline{\text{a}}\text{---}\underline{\text{n}}\text{---}\underline{\text{a}}\text{---}\underline{\text{a}}$
 $Y \rightarrow \text{s}\text{v}\text{k}\text{b}\text{r}\text{l}\text{v}\text{p}\text{n}\text{z}\text{a}\text{n}\text{c}\text{z}\text{y}\text{q}\text{z}\text{a}$

Edit Distance

- Input: two sequences $X = \langle x_1, x_2, \dots, x_m \rangle$
 $Y = \langle y_1, y_2, \dots, y_n \rangle$
- Output: the minimum cost of transformation from X to Y
 - Quantifier of the dissimilarity of two strings

$X = \text{banana}$

$Y = \text{aeniqadikjaz}$

$X = \text{banana}$

$Y = \text{svkbrlvpnzanczyqza}$

9

$X \rightarrow \text{ba} \text{---} \text{n} \text{---} \text{an} \text{---} \text{a} \text{---} \text{a}$
 $Y \rightarrow \text{---} \text{a} \text{e} \text{n} \text{i} \text{q} \text{a} \text{d} \text{i} \text{k} \text{j} \text{a} \text{z}$

1 deletion, 7 insertions, 1 substitution

13

$X \rightarrow \text{---} \text{b} \text{a} \text{---} \text{n} \text{---} \text{a} \text{---} \text{a}$
 $Y \rightarrow \text{s} \text{v} \text{k} \text{b} \text{r} \text{l} \text{v} \text{p} \text{n} \text{z} \text{a} \text{n} \text{c} \text{z} \text{y} \text{q} \text{z} \text{a}$

12 insertions, 1 substitution

Sequence Alignment Problem

- Input: two sequences $X = \langle x_1, x_2, \dots, x_m \rangle$
 $Y = \langle y_1, y_2, \dots, y_n \rangle$
- Output: the minimal cost $M_{m,n}$ for aligning two sequences
 - Cost = #insertions $\times C_{\text{INS}}$ + #deletions $\times C_{\text{DEL}}$ + #substitutions $\times C_{p,q}$

Step 1: Characterize an OPT Solution

Sequence Alignment Problem

Input: two sequences $X = \langle x_1, x_2, \dots, x_m \rangle$ $Y = \langle y_1, y_2, \dots, y_n \rangle$

Output: the minimal cost $M_{m,n}$ for aligning two sequences

- Subproblems
 - $\text{SA}(i, j)$: sequence alignment between prefix strings x_1, \dots, x_i and y_1, \dots, y_j
 - Goal: $\text{SA}(m, n)$
- Optimal substructure: suppose OPT is an optimal solution to $\text{SA}(i, j)$, there are 3 cases:
 - Case 1: x_i and y_j are aligned in OPT (match or substitution)
 - $\text{OPT}/\{x_i, y_j\}$ is an optimal solution of $\text{SA}(i-1, j-1)$
 - Case 2: x_i is aligned with a gap in OPT (deletion)
 - OPT is an optimal solution of $\text{SA}(i-1, j)$
 - Case 3: y_j is aligned with a gap in OPT (insertion)
 - OPT is an optimal solution of $\text{SA}(i, j-1)$

Step 2: Recursively Define the Value of an OPT Solution

Sequence Alignment Problem

Input: two sequences $X = \langle x_1, x_2, \dots, x_m \rangle$ $Y = \langle y_1, y_2, \dots, y_n \rangle$

Output: the minimal cost $M_{m,n}$ for aligning two sequences

- Suppose OPT is an optimal solution to $\text{SA}(i, j)$, there are 3 cases:

- Case 1: x_i and y_j are aligned in OPT (match or substitution)

- $\text{OPT}/\{x_i, y_j\}$ is an optimal solution of $\text{SA}(i-1, j-1)$

$$M_{i,j} = M_{i-1,j-1} + C_{x_i,y_j}$$

- Case 2: x_i is aligned with a gap in OPT (deletion)

- OPT is an optimal solution of $\text{SA}(i-1, j)$

$$M_{i,j} = M_{i-1,j} + C_{\text{DEL}}$$

- Case 3: y_j is aligned with a gap in OPT (insertion)

- OPT is an optimal solution of $\text{SA}(i, j-1)$

$$M_{i,j} = M_{i,j-1} + C_{\text{INS}}$$

- Recursively define the value

$$M_{i,j} = \begin{cases} jC_{\text{INS}} & \text{if } i = 0 \\ iC_{\text{DEL}} & \text{if } j = 0 \\ \min(M_{i-1,j-1} + C_{x_i,y_j}, M_{i-1,j} + C_{\text{DEL}}, M_{i,j-1} + C_{\text{INS}}) & \text{otherwise} \end{cases}$$

Step 3: Compute Value of an OPT Solution

Sequence Alignment Problem

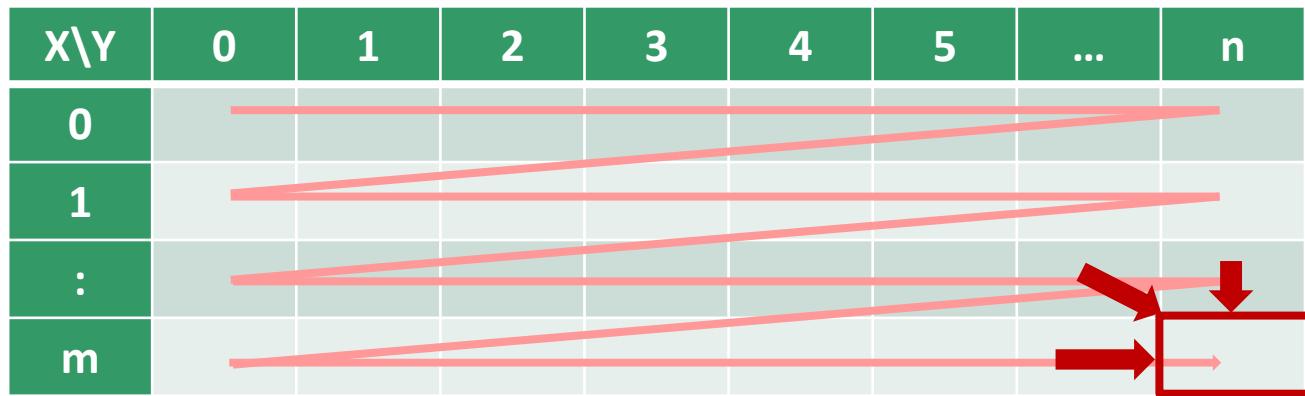

Input: two sequences

Output: the minimal cost $M_{m,n}$ for aligning two sequences

- Bottom-up method: solve smaller subproblems first

$$M_{i,j} = \begin{cases} jC_{\text{INS}} & \text{if } i = 0 \\ iC_{\text{DEL}} & \text{if } j = 0 \\ \min(M_{i-1,j-1} + C_{x_i,y_j}, M_{i-1,j} + C_{\text{DEL}}, M_{i,j-1} + C_{\text{INS}}) & \text{otherwise} \end{cases}$$

X\Y	0	1	2	3	4	5	...	n
0								
1

X\Y	0	1	2	3	4	5	...	n
0								
1								
:								
m								

→ $\Theta(mn)$

- If only keeping the most recent two rows: Space-Seq-Align (X, Y)

X\Y	0	1	2	3	...	j	...	n
i - 1								
i								

→ $\Theta(n)$

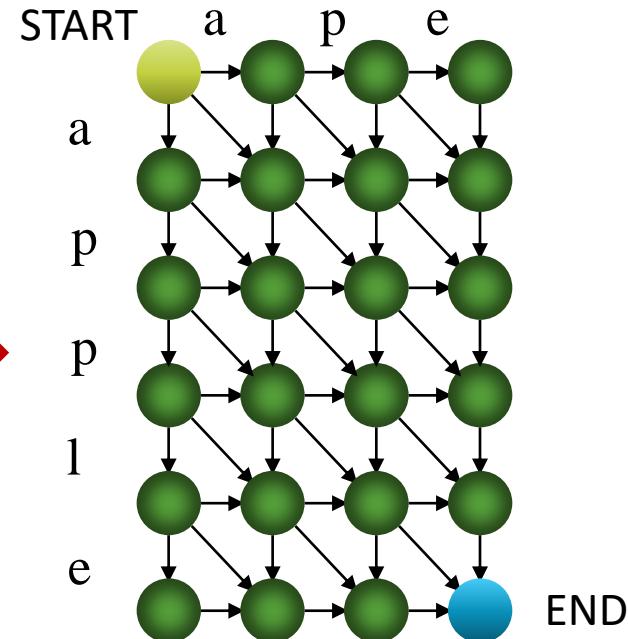

The optimal value can be computed, but the solution cannot be reconstructed

Space-Efficient Solution

Divide-and-Conquer
+
Dynamic Programming

- Problem: find the min-cost alignment → find the shortest path

	a	p	e		
X\Y	0	1	2	3	
0	0	4	8	12	
a	1	4	7	11	15
p	2	8	4	8	12
p	3	12	8	12	8
l	4	16	12	15	12
e	5	20	16	19	15

→ distance = C_{INS}

↓ distance = C_{DEL}

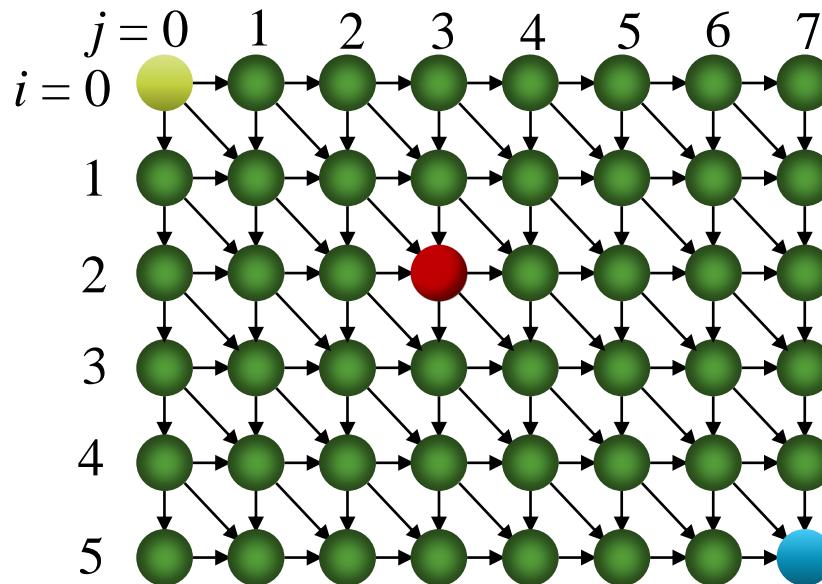

↖ distance = $C_{u,v}$ for edge (u, v)

Shortest Path in Graph

- Each edge has a length/cost
- $F(i, j)$: length of the shortest path from $(0,0)$ to (i, j) (START \rightarrow (i, j))
- $B(i, j)$: length of the shortest path from (i, j) to (m, n) ($(i, j) \rightarrow$ END)
- $F(m, n) = B(0,0)$

$F(2,3)$ = distance of the
shortest path  

$B(2,3)$ = distance of the
shortest path  

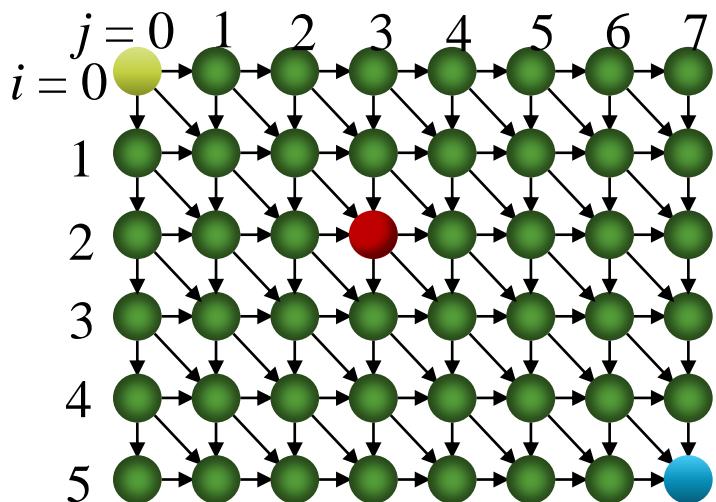

Recursive Equation

- Each edge has a length/cost
- $F(i, j)$: length of the shortest path from $(0,0)$ to (i, j) ($\text{START} \rightarrow (i, j)$)
- $B(i, j)$: length of the shortest path from (i, j) to (m, n) ($(i, j) \rightarrow \text{END}$)
- Forward formulation

$$F_{i,j} = \begin{cases} jC_{\text{INS}} & \text{if } i = 0 \\ iC_{\text{DEL}} & \text{if } j = 0 \\ \min(F_{i-1,j-1} + C_{x_i,y_j}, F_{i-1,j} + C_{\text{DEL}}, F_{i,j-1} + C_{\text{INS}}) & \text{otherwise} \end{cases}$$

- Backward formulation

$$B_{i,j} = \begin{cases} (n - j)C_{\text{INS}} & \text{if } i = m \\ (m - i)C_{\text{DEL}} & \text{if } j = n \\ \min(B_{i+1,j+1} + C_{x_i,y_j}, B_{i+1,j} + C_{\text{DEL}}, B_{i,j+1} + C_{\text{INS}}) & \text{otherwise} \end{cases}$$

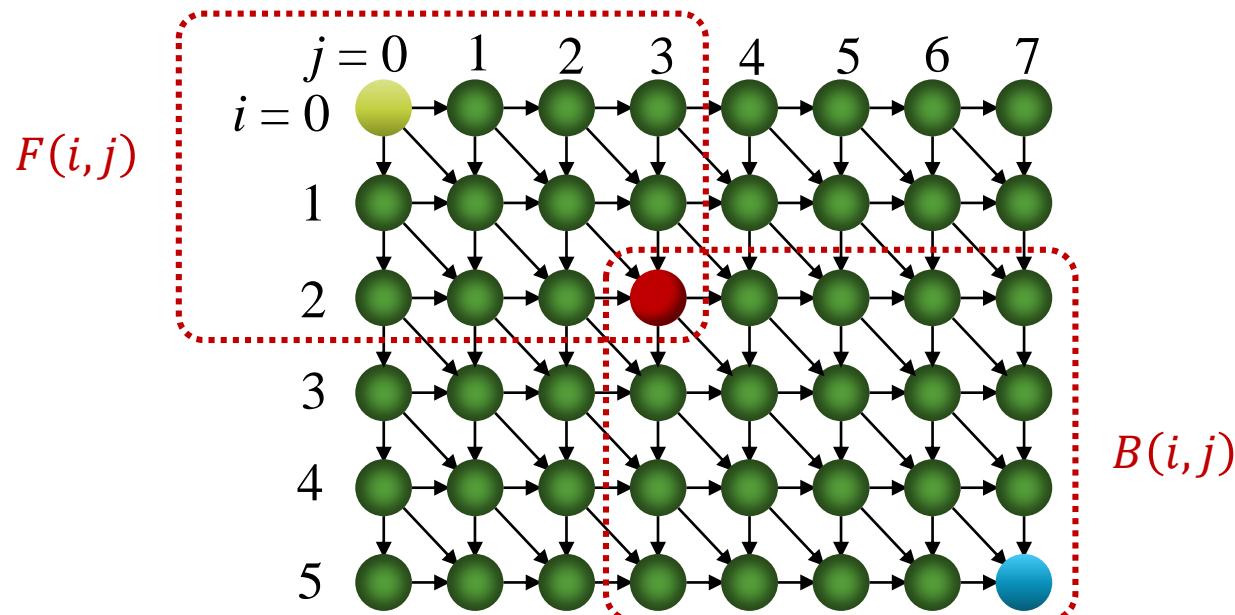

Shortest Path Problem

$F(i, j)$: length of the shortest path from $(0,0)$ to (i,j)

$B(i, j)$: length of the shortest path from (i,j) to (m,n)

- Observation 1: the length of the shortest path from $(0,0)$ to (m,n) that passes through (i,j) is $F(i,j) + B(i,j)$
→ **optimal substructure**

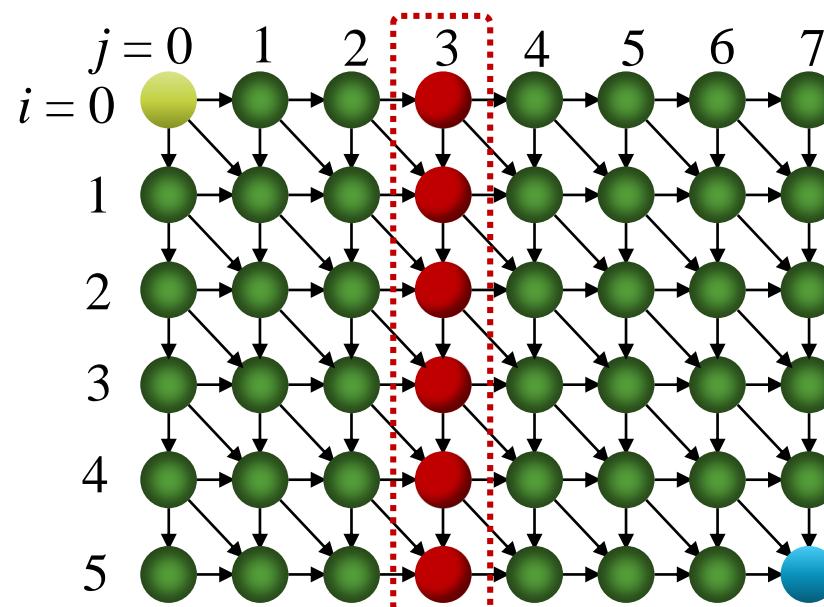

Shortest Path Problem

$F(i, j)$: length of the shortest path from $(0,0)$ to (i, j)

$B(i, j)$: length of the shortest path from (i, j) to (m, n)

- Observation 2: for any v in $\{0, \dots, n\}$, there exists a u s.t. the shortest path between $(0,0)$ and (m, n) goes through (u, v)
→ **the shortest path must go across a vertical cut**

Shortest Path Problem

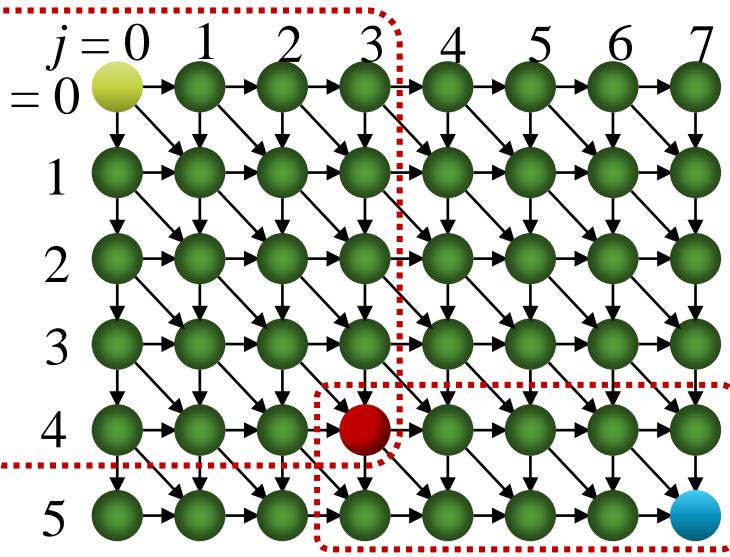

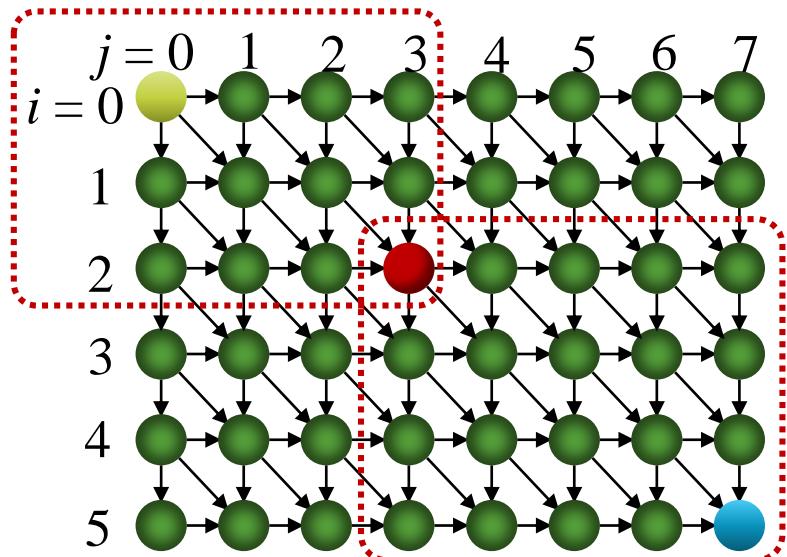

$F(i, j)$: length of the shortest path from $(0,0)$ to (i,j)

$B(i, j)$: length of the shortest path from (i,j) to (m,n)

- Observation 1+2:

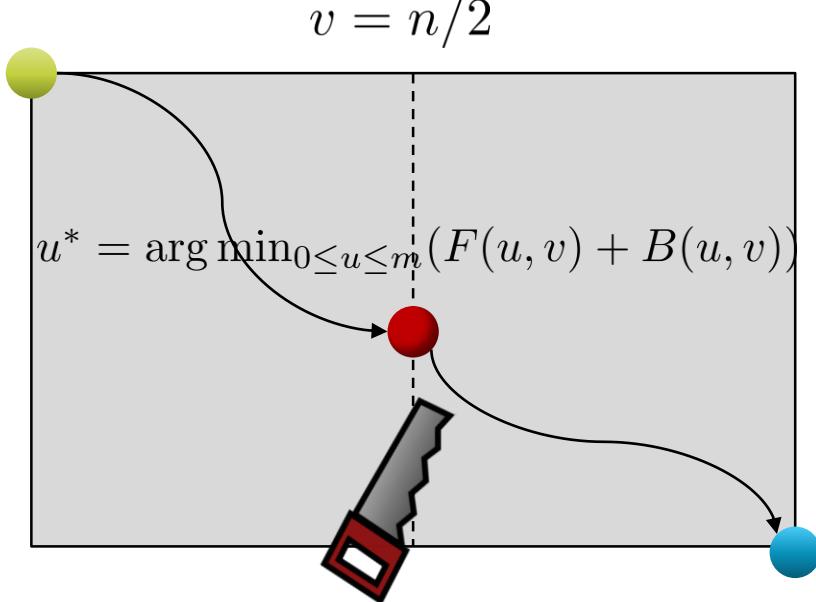

$$F(m, n) = \min (F(0, v) + B(0, v), F(1, v) + B(1, v), \dots, F(m, v) + B(m, v))$$

$$F(m, n) = \min_{0 \leq u \leq m} F(u, v) + B(u, v) \forall v$$

Divide-and-Conquer Algorithm

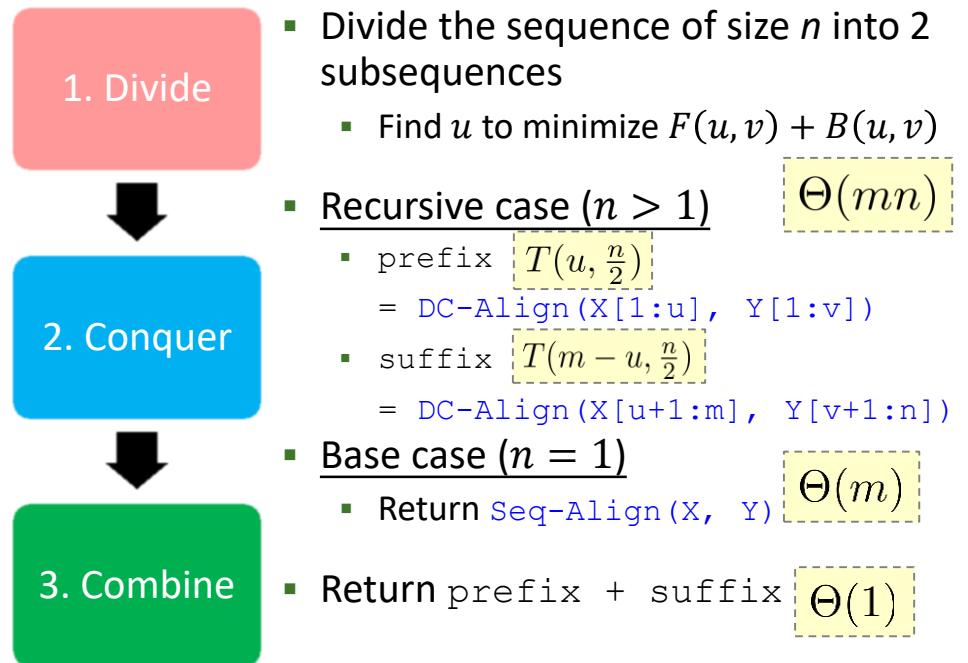

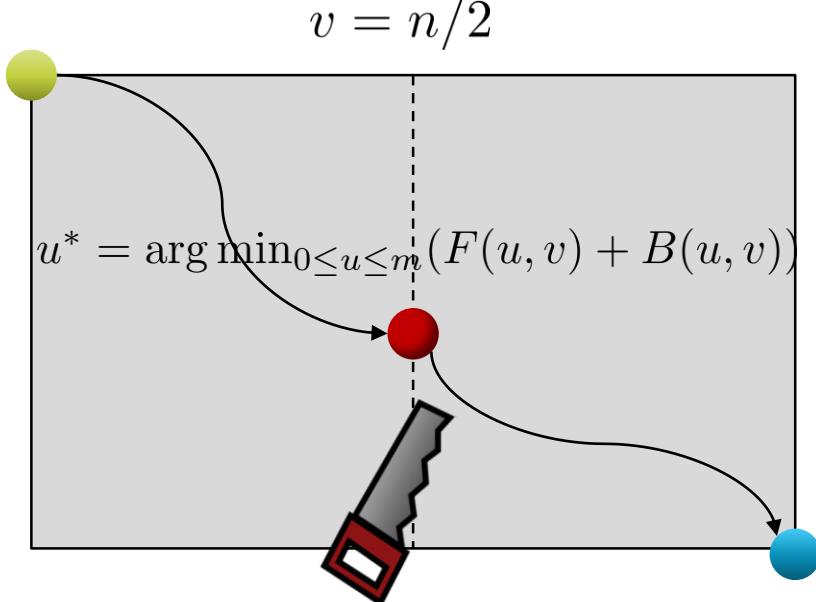

- Goal: finds optimal solution

- How to find the value of u^* ?
- Idea: utilize sequence alignment algo.
 - Call `Space-Space-Seq-Align(X, Y[1:v])` to find $F(0, v), F(1, v), \dots, F(m, v)$ $\Theta(m \times \frac{n}{2})$
 - Call `Back-Space-Space-Seq-Align(X, Y[v+1:n])` to find $B(0, v), B(1, v), \dots, B(m, v)$ $\Theta(m \times \frac{n}{2})$
 - Let u be the index minimizing $F(u, v) + B(u, v)$ $\Theta(m)$

Divide-and-Conquer Algorithm

- Goal: finds optimal solution – **DC-Align (X, Y)** Space Complexity: $O(m + n)$

- $T(m, n)$ = time for running **DC-Align (X, Y)** with $|X| = m, |Y| = n$

$$T(m, n) = \begin{cases} O(m) & \text{if } n = 1 \\ T(u, n/2) + T(m - u, n/2) + O(mn) & \text{if } n \geq 2 \end{cases} \rightarrow T(m, n) = O(mn)$$

Time Complexity Analysis

$$T(m, n) = \begin{cases} O(m) & \text{if } n = 1 \\ T(u, n/2) + T(m - u, n/2) + O(mn) & \text{if } n \geq 2 \end{cases} \rightarrow T(m, n) = O(mn)$$

▪ Proof

- There exists positive constants a, b s.t. all

$$T(m, n) \leq \begin{cases} a \cdot m & \text{if } n = 1 \\ T(u, n/2) + T(m - u, n/2) + b \cdot mn & \text{if } n \geq 2 \end{cases}$$

- Use induction to prove $T(m, n) \leq kmn$

Practice to check the initial condition

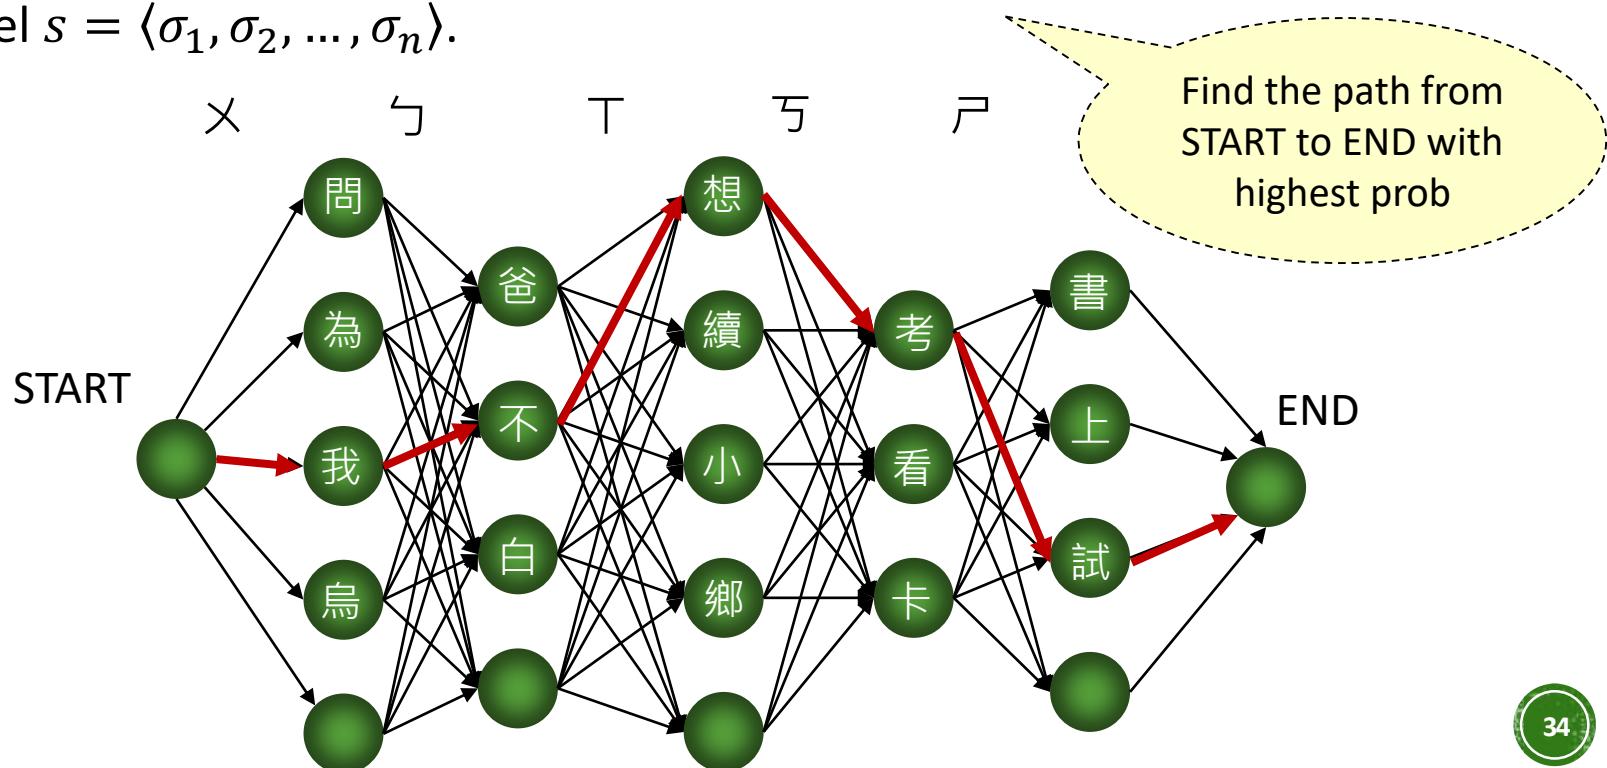

$$T(m, n) \leq T(u, \frac{n}{2}) + T(m - u, \frac{n}{2}) + b \cdot mn$$

Inductive hypothesis

$$\begin{aligned} &\leq ku\frac{n}{2} + k(m - u)\frac{n}{2} + b \cdot mn \\ &\leq (\frac{k}{2} + b)mn \\ &\leq kmn \quad \text{when } k \geq 2b \end{aligned}$$

Extension: 注音文 Recognition

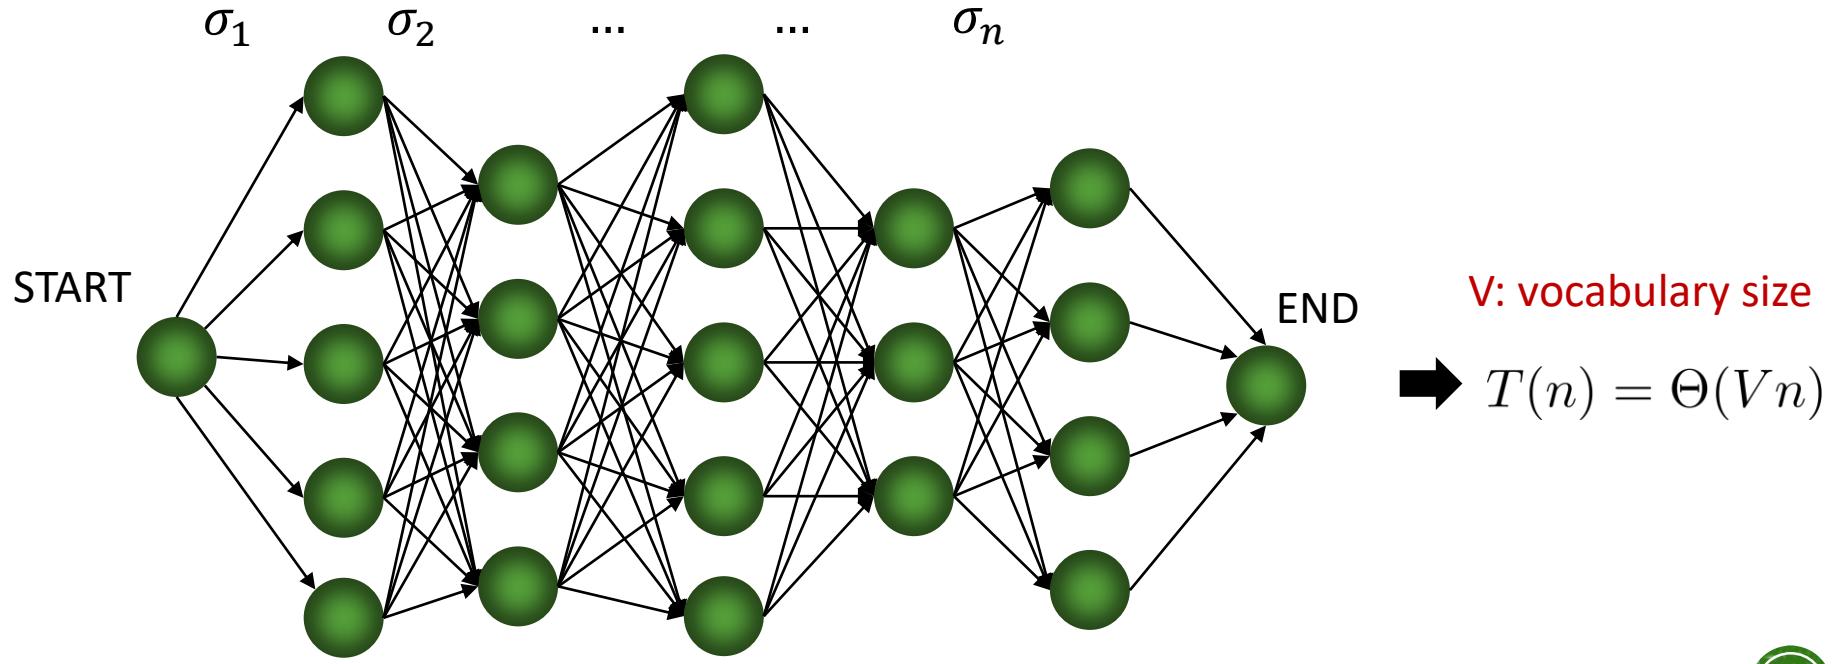

- Given a graph $G = (V, E)$, each edge $(u, v) \in E$ has an associated non-negative probability $p(u, v)$ of traversing the edge (u, v) and producing the corresponding character. Find the most probable path with the label $s = \langle \sigma_1, \sigma_2, \dots, \sigma_n \rangle$.

Viterbi Algorithm

$$P_{i,j} = \begin{cases} p(\text{START}, v) & \text{if } j = 1 \\ \max_k(P_{k,j-1} \times p(u, v)) & \text{otherwise} \end{cases}$$

produce σ_1
produce σ_j

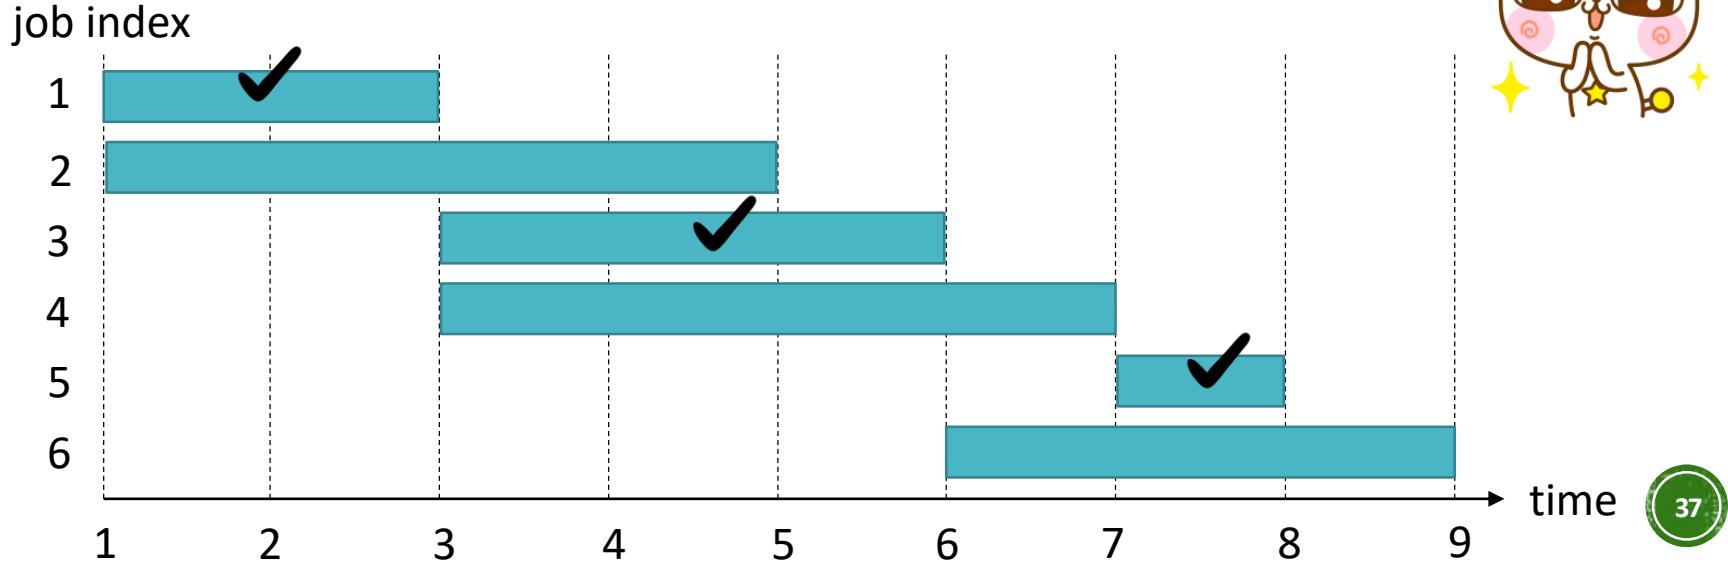

Viterbi has been applied to many AI applications, e.g. speech recognition

Weighted Interval Scheduling

Interval Scheduling

- Input: n job requests with start times s_i , finish times f_i
- Output: the maximum number of compatible jobs
- The interval scheduling problem can be solved using an “**early-finish-time-first**” greedy algorithm in $O(n)$ time

Weighted Interval Scheduling

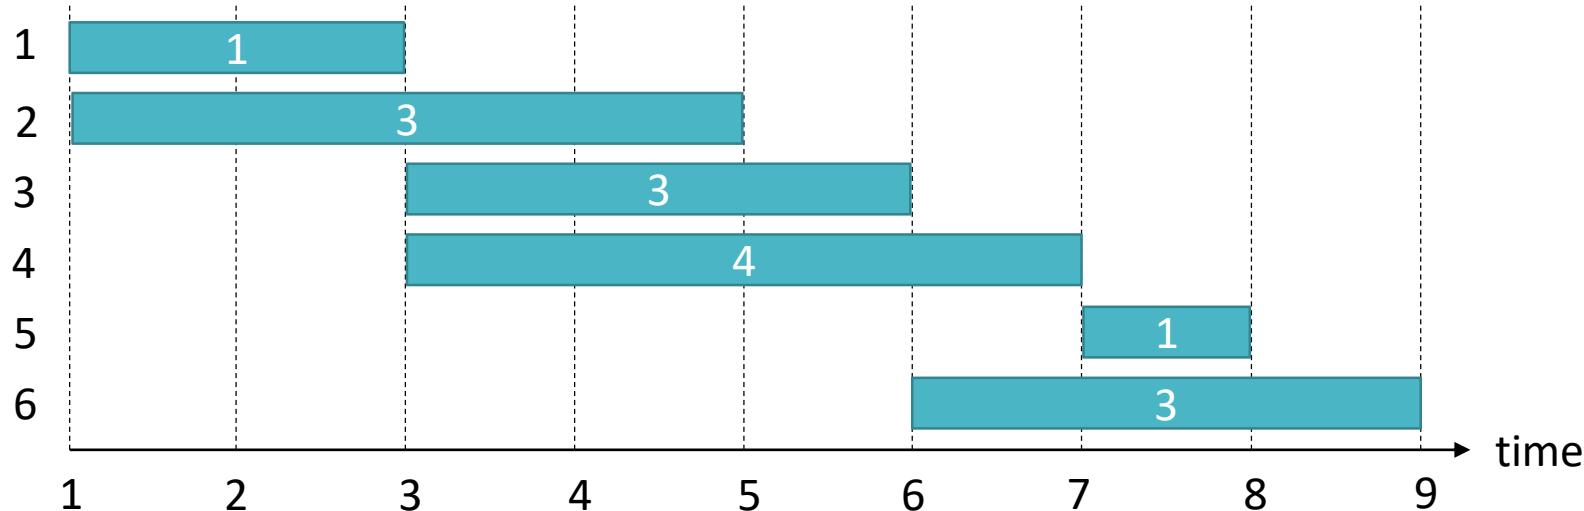

- Input: n job requests with start times s_i , finish times f_i , and values v_i
- Output: the maximum total value obtainable from compatible jobs

Assume that the requests are sorted in non-decreasing order ($f_i \leq f_j$ when $i < j$)

$p(j)$ = largest index $i < j$ s.t. jobs i and j are compatible

e.g. $p(1) = 0, p(2) = 0, p(3) = 1, p(4) = 1, p(5) = 4, p(6) = 3$

job index

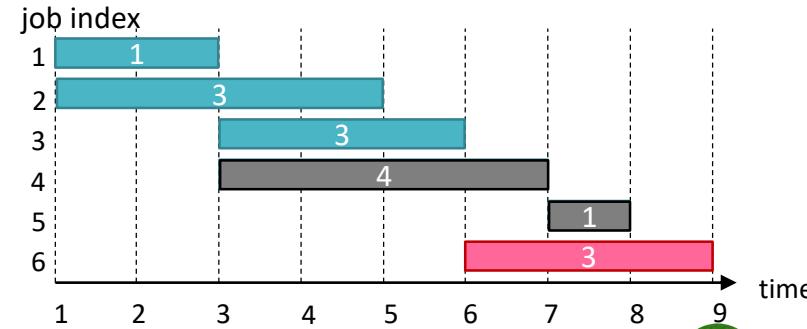

Step 1: Characterize an OPT Solution

Weighted Interval Scheduling Problem

Input: n jobs with $\langle s_i, f_i, v_i \rangle$, $p(j) = \text{largest index } i < j \text{ s.t. jobs } i \text{ and } j \text{ are compatible}$
Output: the maximum total value obtainable from compatible

- Subproblems
 - $\text{WIS}(i)$: weighted interval scheduling for the first i jobs
 - Goal: $\text{WIS}(n)$
- Optimal substructure: suppose OPT is an optimal solution to $\text{WIS}(i)$, there are 2 cases:
 - Case 1: job i in OPT
 - $\text{OPT} \setminus \{i\}$ is an optimal solution of $\text{WIS}(p(i))$
 - Case 2: job i not in OPT
 - OPT is an optimal solution of $\text{WIS}(i-1)$

Step 2: Recursively Define the Value of an OPT Solution

Weighted Interval Scheduling Problem

Input: n jobs with $\langle s_i, f_i, v_i \rangle$, $p(j) = \text{largest index } i < j \text{ s.t. jobs } i \text{ and } j \text{ are compatible}$
Output: the maximum total value obtainable from compatible

- Optimal substructure: suppose OPT is an optimal solution to $\text{WIS}(i)$, there are 2 cases:
 - Case 1: job i in OPT
 - $\text{OPT} \setminus \{i\}$ is an optimal solution of $\text{WIS}(p(i))$
 - Case 2: job i not in OPT
 - OPT is an optimal solution of $\text{WIS}(i-1)$
- Recursively define the value

$$M_i = \begin{cases} 0 & \text{if } i = 0 \\ \max(v_i + M_{p(i)}, M_{i-1}) & \text{otherwise} \end{cases}$$

$$M_i = v_i + M_{p(i)}$$

$$M_i = M_{i-1}$$

Step 3: Compute Value of an OPT Solution

Weighted Interval Scheduling Problem

Input: n jobs with $\langle s_i, f_i, v_i \rangle$, $p(j) =$ largest index $i < j$ s.t. jobs i and j are compatible
Output: the maximum total value obtainable from compatible

- Bottom-up method: solve smaller subproblems first

$$M_i = \begin{cases} 0 & \text{if } i = 0 \\ \max(v_i + M_{p(i)}, M_{i-1}) & \text{otherwise} \end{cases}$$

i	0	1	2	3	4	5	...	n
M[i]								

```
WIS(n, s, f, v, p)
```

```
    M[0] = 0
    for i = 1 to n
        M[i] = max(v[i] + M[p[i]], M[i - 1])
    return M[n]
```

$$T(n) = \Theta(n)$$

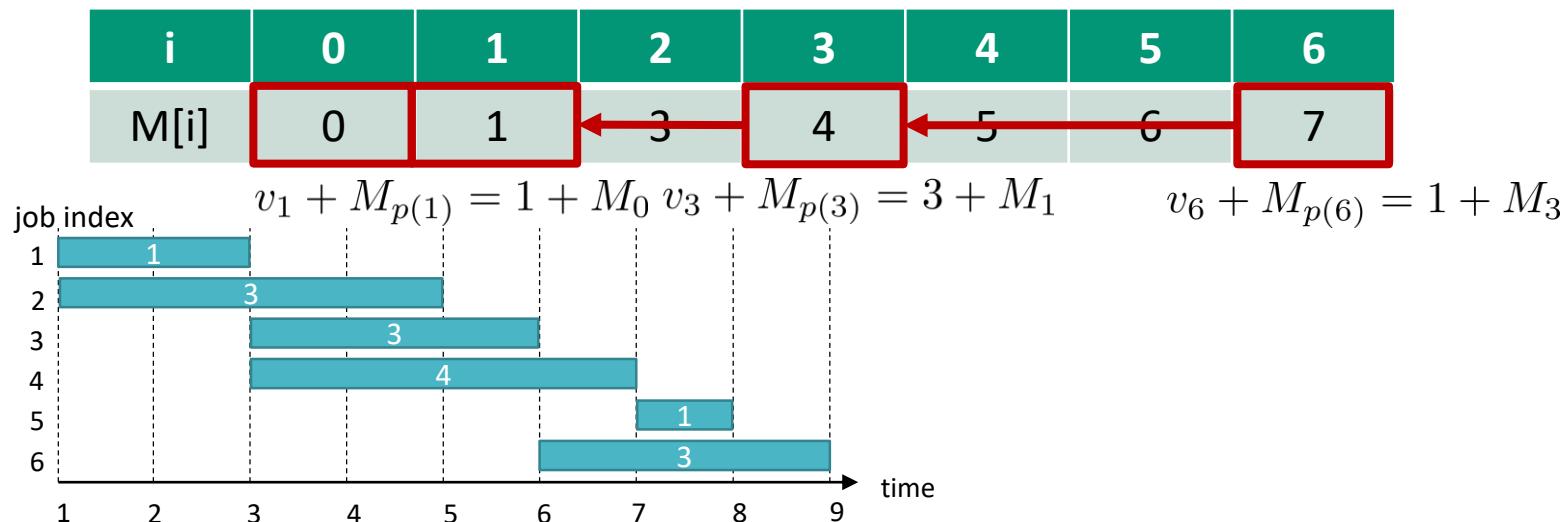

Step 4: Construct an OPT Solution by Backtracking

Weighted Interval Scheduling Problem

Input: n jobs with $\langle s_i, f_i, v_i \rangle$, $p(j) = \text{largest index } i < j \text{ s.t. jobs } i \text{ and } j \text{ are compatible}$
Output: the maximum total value obtainable from compatible

- Bottom-up method: solve smaller subproblems first

$$M_i = \begin{cases} 0 & \text{if } i = 0 \\ \max(v_i + M_{p(i)}, M_{i-1}) & \text{otherwise} \end{cases}$$

Step 4: Construct an OPT Solution by Backtracking

Weighted Interval Scheduling Problem

Input: n jobs with $\langle s_i, f_i, v_i \rangle$, $p(j)$ = largest index $i < j$ s.t. jobs i and j are compatible
Output: the maximum total value obtainable from compatible

```
WIS(n,  s,  f,  v,  p)
    M[0] = 0
    for i = 1 to n
        M[i] = max(v[i] + M[p[i]],  M[i - 1])
    return M[n]
```

$$T(n) = \Theta(n)$$

```
Find-Solution(M,  n)
    if n = 0
        return {}
    if v[n] + M[p[n]] > M[n-1] // case 1
        return {n} ∪ Find-Solution(p[n])
    return Find-Solution(n-1) // case 2
```

$$T(n) = \Theta(n)$$

Knapsack Problem (背包問題)

Textbook Exercise 16.2-2

Knapsack Problem

- Input: n items where i -th item has value v_i and weighs w_i (v_i and w_i are positive integers)
- Output: the maximum value for the knapsack with capacity of W
- Variants of knapsack problem
 - 0-1 Knapsack Problem: 每項物品只能拿一個
 - Unbounded Knapsack Problem: 每項物品可以拿多個
 - Multidimensional Knapsack Problem: 背包空間有限
 - Multiple-Choice Knapsack Problem: 每一類物品最多拿一個
 - Fractional Knapsack Problem: 物品可以只拿部分

Knapsack Problem

- Input: n items where i -th item has value v_i and weighs w_i (v_i and w_i are positive integers)
- Output: the maximum value for the knapsack with capacity of W
- Variants of knapsack problem
 - **0-1 Knapsack Problem:** 每項物品只能拿一個
 - Unbounded Knapsack Problem: 每項物品可以拿多個
 - Multidimensional Knapsack Problem: 背包空間有限
 - Multiple-Choice Knapsack Problem: 每一類物品最多拿一個
 - Fractional Knapsack Problem: 物品可以只拿部分

Step 1: Characterize an OPT Solution

0-1 Knapsack Problem

Input: n items where i -th item has value v_i and weighs w_i

Output: the max value within W capacity, where each item is chosen **at most once**

- Subproblems

$\text{ZO-KP}(i)$

$\text{ZO-KP}(i, w)$

consider the available capacity

- $\text{ZO-KP}(i, w)$: 0-1 knapsack problem within w capacity for the first i items
- Goal: $\text{ZO-KP}(n, W)$
- Optimal substructure: suppose OPT is an optimal solution to $\text{ZO-KP}(i, w)$, there are 2 cases:
 - Case 1: item i in OPT
 - $\text{OPT} \setminus \{i\}$ is an optimal solution of $\text{ZO-KP}(i - 1, w - w_i)$
 - Case 2: item i not in OPT
 - OPT is an optimal solution of $\text{ZO-KP}(i - 1, w)$

Step 2: Recursively Define the Value of an OPT Solution

0-1 Knapsack Problem

Input: n items where i -th item has value v_i and weighs w_i

Output: the max value within W capacity, where each item is chosen **at most once**

- Optimal substructure: suppose OPT is an optimal solution to $\text{ZO-KP}(i, w)$, there are 2 cases:

- Case 1: item i in OPT

- $\text{OPT} \setminus \{i\}$ is an optimal solution of $\text{ZO-KP}(i - 1, w - w_i)$

$$M_{i,w} = v_i + M_{i-1,w-w_i}$$

- Case 2: item i not in OPT

- OPT is an optimal solution of $\text{ZO-KP}(i - 1, w)$

$$M_{i,w} = M_{i-1,w}$$

- Recursively define the value

$$M_{i,w} = \begin{cases} 0 & \text{if } i = 0 \\ M_{i-1,w} & \text{if } w_i > w \\ \max(v_i + M_{i-1,w-w_i}, M_{i-1,w}) & \text{otherwise} \end{cases}$$

Step 3: Compute Value of an OPT Solution

0-1 Knapsack Problem

Input: n items where i -th item has value v_i and weighs w_i

Output: the max value within W capacity, where each item is chosen **at most once**

- Bottom-up method: solve smaller subproblems first

$$M_{i,w} = \begin{cases} 0 & \text{if } i = 0 \\ M_{i-1,w} & \text{if } w_i > w \\ \max(v_i + M_{i-1,w-w_i}, M_{i-1,w}) & \text{otherwise} \end{cases}$$

i\w	0	1	2	3	...	w	...	W

3	0	4	9	13	20	24

Step 3: Compute Value of an OPT Solution

0-1 Knapsack Problem

Input: n items where i -th item has value v_i and weighs w_i

Output: the max value within W capacity, where each item is chosen **at most once**

- Bottom-up method: solve smaller subproblems first

$$M_{i,w} = \begin{cases} 0 & \text{if } i = 0 \\ M_{i-1,w} & \text{if } w_i > w \\ \max(v_i + M_{i-1,w-w_i}, M_{i-1,w}) & \text{otherwise} \end{cases}$$

```
ZO-KP(n, v, W)
for w = 0 to W
    M[0, w] = 0
for i = 1 to n
    for w = 0 to W
        if(wi > w)
            M[i, w] = M[i-1, w]
        else
            M[i, w] = max(vi + M[i-1, w-wi], M[i-1, w])
return M[n, W]
```

$$T(n) = \Theta(nW)$$

Step 4: Construct an OPT Solution by Backtracking

```
ZO-KP (n, v, w)
    for w = 0 to W
        M[0, w] = 0
    for i = 1 to n
        for w = 0 to W
            if (wi > w)
                M[i, w] = M[i-1, w]
            else
                M[i, w] = max (vi + M[i-1, w-wi], M[i-1, w])
    return M[n, W]
```

$$T(n) = \Theta(nW)$$

```
Find-Solution (M, n, W)
    S = {}
    w = W
    for i = n to 1
        if M[i, w] > M[i - 1, w] // case 1
            w = w - wi
            S = S ∪ {i}
    return S
```

$$T(n) = \Theta(n)$$

Pseudo-Polynomial Time

- Polynomial: polynomial in the **length of the input** (#bits for the input)
- Pseudo-polynomial: polynomial in the **numeric value**
- The time complexity of 0-1 knapsack problem is $\Theta(nW)$
 - n : number of objects
 - W : knapsack's capacity (non-negative integer)
 - polynomial in the numeric value
 - = pseudo-polynomial in input size
 - = exponential in the length of the input
- Note: the size of the representation of W is $\log_2 W$
 $= 2^m \quad = m$

Knapsack Problem

- Input: n items where i -th item has value v_i and weighs w_i (v_i and w_i are positive integers)
- Output: the maximum value for the knapsack with capacity of W
- Variants of knapsack problem
 - 0-1 Knapsack Problem: 每項物品只能拿一個
 - **Unbounded Knapsack Problem:** 每項物品可以拿多個
 - Multidimensional Knapsack Problem: 背包空間有限
 - Multiple-Choice Knapsack Problem: 每一類物品最多拿一個
 - Fractional Knapsack Problem: 物品可以只拿部分

Step 1: Characterize an OPT Solution

Unbounded Knapsack Problem

Input: n items where i -th item has value v_i and weighs w_i , each has **unlimited supplies**

Output: the max value within W capacity

- Subproblems
 - $\text{U-KP}(i, w)$: unbounded knapsack problem with w capacity for the first i items
 - Goal: $\text{U-KP}(n, W)$

0-1 Knapsack Problem	Unbounded Knapsack Problem
each item can be chosen at most once	each item can be chosen multiple times
a sequence of binary choices : whether to choose item i	a sequence of i choices : which one (from 1 to i) to choose
Time complexity = $\Theta(nW)$	Time complexity = $\Theta(n^2W)$

Can we do better?

Step 1: Characterize an OPT Solution

Unbounded Knapsack Problem

Input: n items where i -th item has value v_i and weighs w_i , each has **unlimited supplies**

Output: the max value within W capacity

- Subproblems
 - $\text{U-KP}(w)$: unbounded knapsack problem with w capacity
 - Goal: $\text{U-KP}(W)$
- Optimal substructure: suppose OPT is an optimal solution to $\text{U-KP}(w)$, there are n cases:
 - Case 1: item 1 in OPT
 - Removing an item 1 from OPT is an optimal solution of $\text{U-KP}(w - w_1)$
 - Case 2: item 2 in OPT
 - Removing an item 2 from OPT is an optimal solution of $\text{U-KP}(w - w_2)$
 - :
 - Case n : item n in OPT
 - Removing an item n from OPT is an optimal solution of $\text{U-KP}(w - w_n)$

Step 2: Recursively Define the Value of an OPT Solution

Unbounded Knapsack Problem

Input: n items where i -th item has value v_i and weighs w_i , each has **unlimited supplies**

Output: the max value within W capacity

- Optimal substructure: suppose OPT is an optimal solution to U-KP (w) , there are n cases:
 - Case i : item i in OPT
 - Removing an item i from OPT is an optimal solution of U-KP ($w - w_i$)
- Recursively define the value

$$M_w = v_i + M_{w-w_i}$$

$$M_w = \begin{cases} 0 & \text{if } w = 0 \text{ or } w_i > w \text{ for all } i \\ \max_{1 \leq i \leq n} \boxed{w_i \leq w} (v_i + M_{w-w_i}) & \text{otherwise} \end{cases}$$

只考慮背包還裝的下的情形

Exercise

Multidimensional Knapsack Problem

Input: n items where i -th item has value v_i , weighs w_i , and size d_i

Output: the max value within W capacity and with **the size of D** , where each item is chosen at most once

- Step 3: Compute Value of an OPT Solution
- Step 4: Construct an OPT Solution by Backtracking
- What is the time complexity?

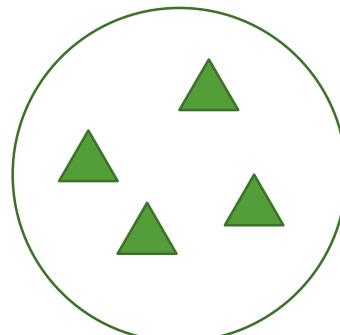

Knapsack Problem

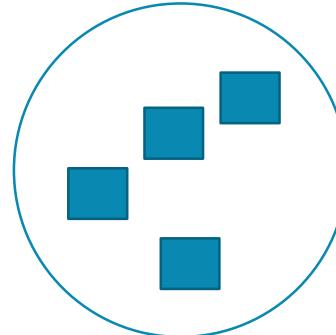

- Input: n items where i -th item has value v_i and weighs w_i (v_i and w_i are positive integers)
- Output: the maximum value for the knapsack with capacity of W
- Variants of knapsack problem
 - 0-1 Knapsack Problem: 每項物品只能拿一個
 - Unbounded Knapsack Problem: 每項物品可以拿多個
 - Multidimensional Knapsack Problem: 背包空間有限
 - **Multiple-Choice Knapsack Problem: 每一類物品最多拿一個**
 - Fractional Knapsack Problem: 物品可以只拿部分

Multiple-Choice Knapsack Problem

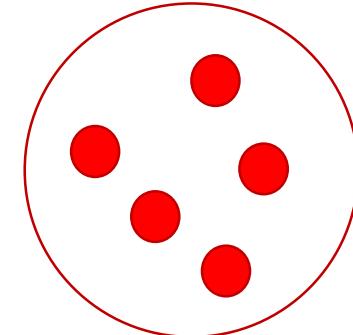

- Input: n items
 - $v_{i,j}$: value of j -th item in the group i
 - $w_{i,j}$: weight of j -th item in the group i
 - n_i : number of items in group i
 - n : total number of items ($\sum n_i$)
 - G : total number of groups
- Output: the maximum value for the knapsack with capacity of W , where **the item from each group can be selected at most once**

group 1

group 2

group 3

Step 1: Characterize an OPT Solution

Multiple-Choice Knapsack Problem

Input: n items with value $v_{i,j}$ and weighs $w_{i,j}$ (n_i : #items in group i , G : #groups)

Output: the max value within W capacity, where each group is chosen **at most once**

- Subproblems
 - $\text{MC-KP } (w)$: w capacity
 - $\text{MC-KP } (i, w)$: w capacity for the first i groups the constraint is for groups
 - $\text{MC-KP } (i, j, w)$: w capacity for the first j items from first i groups

Which one is more suitable for this problem?

Step 1: Characterize an OPT Solution

Multiple-Choice Knapsack Problem

Input: n items with value $v_{i,j}$ and weighs $w_{i,j}$ (n_i : #items in group i , G : #groups)

Output: the max value within W capacity, where each group is chosen **at most once**

- Subproblems
 - $\text{MC-KP}(i, w)$: multi-choice knapsack problem with w capacity for the first i groups
 - Goal: $\text{MC-KP}(G, W)$
- Optimal substructure: suppose OPT is an optimal solution to $\text{MC-KP}(i, w)$, for the group i , there are $n_i + 1$ cases:
 - Case 1: no item from i -th group in OPT
 - OPT is an optimal solution of $\text{MC-KP}(i - 1, w)$
 - :
 - Case $j + 1$: j -th item from i -th group ($\text{item}_{i,j}$) in OPT
 - $\text{OPT} \setminus \text{item}_{i,j}$ is an optimal solution of $\text{MC-KP}(i - 1, w - w_{i,j})$

Step 2: Recursively Define the Value of an OPT Solution

Multiple-Choice Knapsack Problem

Input: n items with value $v_{i,j}$ and weighs $w_{i,j}$ (n_i : #items in group i , G : #groups)

Output: the max value within W capacity, where each group is chosen **at most once**

- Optimal substructure: suppose OPT is an optimal solution to MC-KP (i , w), for the group i , there are $n_i + 1$ cases:

- Case 1: no item from i -th group in OPT $M_{i,w} = M_{i-1,w}$
- OPT is an optimal solution of MC-KP ($i - 1$, w)
- Case $j + 1$: j -th item from i -th group ($\text{item}_{i,j}$) in OPT $M_{i,w} = v_{i,j} + M_{i-1,w-w_{i,j}}$
- OPT\item $_{i,j}$ is an optimal solution of MC-KP ($i - 1$, $w - w_{i,j}$)

- Recursively define the value

$$M_{i,w} = \begin{cases} 0 & \text{if } i = 0 \\ M_{i-1,w} & \text{if } w_{i,j} > w \text{ for all } j \\ \max_{1 \leq j \leq n_i} (v_{i,j} + M_{i-1,w-w_{i,j}}, M_{i-1,w}) & \text{otherwise} \end{cases}$$

$n_i + 1$

Step 3: Compute Value of an OPT Solution

Multiple-Choice Knapsack Problem

Input: n items with value $v_{i,j}$ and weighs $w_{i,j}$ (n_i : #items in group i , G : #groups)

Output: the max value within W capacity, where each group is chosen **at most once**

- Bottom-up method: solve smaller subproblems first

$$M_{i,w} = \begin{cases} 0 & \text{if } i = 0 \\ M_{i-1,w} & \text{if } w_{i,j} > w \text{ for all } j \\ \max_{1 \leq j \leq n_i} (v_{i,j} + M_{i-1,w-w_{i,j}}, M_{i-1,w}) & \text{otherwise} \end{cases}$$

            M[i, w] = M[i - 1, w]
            for j = 1 to ni // check items in group i
                if(vi,j + M[i - 1, w - wi,j] > M[i, w])
                    M[i, w] = vi,j + M[i - 1, w - wi,j]
                    B[i, w] = j
    return M[G, W], B[G, W]
```

$$T(n) = \Theta(nW)$$

Practice to write the pseudo code for [Find-Solution\(\)](#)

$$T(n) = \Theta(G + W)$$

Knapsack Problem

- Input: n items where i -th item has value v_i and weighs w_i (v_i and w_i are positive integers)
- Output: the maximum value for the knapsack with capacity of W
- Variants of knapsack problem
 - 0-1 Knapsack Problem: 每項物品只能拿一個
 - Unbounded Knapsack Problem: 每項物品可以拿多個
 - Multidimensional Knapsack Problem: 背包空間有限
 - Multiple-Choice Knapsack Problem: 每一類物品最多拿一個
 - **Fractional Knapsack Problem:** 物品可以只拿部分

Fractional Knapsack Problem

- Input: n items where i -th item has value v_i and weighs w_i (v_i and w_i are positive integers)
- Output: the maximum value for the knapsack with capacity of W , where we can take **any fraction of items**
- Dynamic programming algorithm should work
- Choose maximal $\frac{v_i}{w_i}$ (類似CP值) first

Can we do better?

“Greedy Algorithm”
Next topic!

Concluding Remarks

- “Dynamic Programming”: solve many subproblems in polynomial time for which a naïve approach would take exponential time
- When to use DP
 - Whether subproblem solutions can combine into the original solution
 - When subproblems are overlapping
 - Whether the problem has optimal substructure
 - Common for optimization problem
- Two ways to avoid recomputation
 - Top-down with memoization
 - Bottom-up method
- Complexity analysis
 - Space for tabular filling
 - Size of the subproblem graph
